A Practical Guide to the Study of Glacial Sediments is a guide to the standard techniques employed to read the sedimentary record of former glaciers and ice sheets. It demonstrates that the complex and fragmentary glacial sedimentary record can, when examined systematically and rationally, provide detailed insights into former environments and climates, thereby delivering a critical component of palaeoglaciological reconstruction. The complementary techniques covered in this book include facies description, grain size analysis, clast form assessment, clast macrofabric analysis, micromorphology, particle lithology and analysis of engineering properties. They yield consistent and meaningful results in a range of glacial depositional environments throughout the world, from the High Arctic to the Himalayas. This provides students and researchers with a clear and accessible guide to recording and interpreting glacial successions wherever the location.

David J A Evans is a Professor in the Department of Geography, Durham University, UK. He edited *Glacial Landscapes* (2004) and authored *Till – A Glacial Process Sedimentology* (2018) and *Glaciation – A Very Short Introduction* (2018).

Douglas I. Benn is Professor of Environmental Change in the School of Geography and Sustainable Development, University of St Andrews. Previously, he spent 10 years as Professor of Glaciology at the University Centre in Svalbard, Arctic Norway.

The authors previously collaborated on the first and second editions of *Glaciers and Glaciation* (1998, 2010) and the first edition of *A Practical Guide to the Study of Glacial Sediments* (2004).
